Cron Jobs & Reconciliation — Coverage & The Copy-Pasted Cron Bug

InstantMudra Enterprises Admin Portal

Reconciliation cron coverage by domain

AEPS
No reconciliation cron exists at all

DMT
No reconciliation cron exists at all

PG
Runs (buggy cron) — result discarded, inert

Payout
Runs (buggy cron) — persists, partial vendor cover.

Recharge / BBPS / BillAvenue
Recharge: runs correctly, persists
BillAvenue: runs hourly, separate cron

⚠ Three reconciliation schedulers share one copy-pasted, buggy cron expression

PgCheckStatusScheduler
`cron = "0 */59 * * * *"`
// comment says "every 59 minutes"
Actual: fires at minute :00 AND :59 — twice per hour, 1 minute apart

PayoutCheckStatusScheduler
`cron = "0 */59 * * * *"`
// comment says "every 10 minutes"
Identical expression, different wrong comment — copy-pasted, not fixed

BBPSRechargeCheckStatusScheduler
`cron = "0 */59 * * * *"`
// comment says "every 5 minutes"
Same identical expression again, a third different wrong comment

*/n in a cron minute field (range 0-59) means "0, n, 2n, ..." within range — */59 yields only {0, 59}, i.e. two firings clustered near the top of each hour, never the evenly-spaced interval any of the three comments describe.

PG reconciliation is completely inert

```
PgStatusResponse vendorResponse = initiator.checkStatus(orderId);
// — nothing else. Not persisted, not compared, not forwarded to the transaction engine.
```

PGOrchestrator.checkStatusForPendingTransactions() calls the vendor's status API for every PENDING transaction, assigns the response to a local variable, and the method ends. The call happens (twice an hour, per the bug above) — the result has zero effect on any transaction's state.

Payout & Recharge reconciliation — properly wired, partial vendor coverage

Both persist the finalized status AND forward to TransactionEngineServiceImpl.processTransaction()
PayoutOrchestrator.checkStatusForPendingTransactions() and RechargeStatusScheduler.checkPendingTransactions() both: call vendor status API → map response → save new status → build DTO → hand off to the central transaction engine. This is the correct shape — a real contrast to PG.

Payout coverage gated by VendorStatusChecker
5 of 7 payout vendor impls implement the marker interface: NixaSoft, RunPaisa, Unisus, VimoPay, Slpe ✓

RazorpayPayoutServiceImpl and ShadvalPayoutServiceImpl do NOT — their pending transactions are silently skipped
(getVendorStatusChecker() returns null → continue, just a log.warn(), no escalation) every cron run.

RechargeStatusScheduler — minor dead code + another stale comment
Two overloads of getVendorCredentials() exist — only the String subProductId version is ever called; the RechargeTransaction-typed overload is dead. Two @Autowired VendorCredentialsRepository fields under different names. Comment says "Runs every 30 seconds" on a job whose actual cron is */5 (every 5 minutes) — correct cron, wrong comment.

Report schedulers (5 files) — comparatively well-formed
HourlyReportScheduler, TransactionReportScheduler, WalletHistoryReportScheduler, WalletPreviewReportScheduler, ChargeCommissionReportScheduler — each has its own distinct, correct cron expression; no copy-paste bug found here.

Correctly implemented · Flagged bug / partial coverage · Severe — inert or missing entirely · Minor / dead code
