Fund Movement — Two Silent-Failure Bugs, One Dead Approval Path

InstantMudra Enterprises Admin Portal

⚠ CRITICAL — MoveToBankServiceImpl: AES branch never debits, always reports failure

sendPayoutRequest() — if ("AES".equalsIgnoreCase(credentials.getTokenType()))

AES branch (Admin Panel vendor)

1. generateTokenForAES()
2. restTemplate.exchange(...) — sends the payout
3. response received — never read or checked

✗ **NO commonMethods.updateWallet() call anywhere**
✗ **NO return statement in this branch**

→ falls through past the if/else entirely

else branch (RunPaisa / non-AES vendor) — for contrast

1. commonMethods.updateWallet(...) — debits FIRST
2. restTemplate.exchange(...) — sends the payout
3. checks payoutResponse.getStatus() == "ACCEPTED"
4. returns CommonResponse(200, ...) or (400, ...) accordingly — correctly wired, real return either way

AES branch falls through to the method's final line:

```
return new CommonResponse<>(500, "Something went wrong", null);
```

Every AES-flow payout — successful or not — is reported as HTTP 500 to the caller, and the retailer's wallet is never debited either way.

⚠ CRITICAL — RazorpayPayoutServiceImpl.sendPayout() always returns null on success

```
try {
   ... create Razorpay contact + fund account if missing ...
   PayoutResponseDto payoutResponse = createPayoutAPI(...); // computed, never used
} catch (Exception e) {
   return PayoutResponseDto.builder().status("FAILED")...build(); // only path with a real return
} finally { commonFunctions.saveVendorLogs(...); }
return null; // ← unconditional, reached on every non-exception path
```

A genuinely successful payout takes the try block to completion normally — and still returns null.

Successful Razorpay payouts are indistinguishable from null/failure to every caller — money moves, the system reports it didn't.

FundRequestServiceImpl (dead approval path) vs. PrefundRequestServiceImpl (the live one)

FundRequestServiceImpl — approval is dead

✓ raiseFundRequest() — live, creates the request
✓ fetchAllRecords() — live, lists requests

✗ **takeActionOnFundRequest() — entirely commented** out (43 lines). No approve/reject path exists through this service at all — a request raised here can never be actioned here.

PrefundRequestServiceImpl — the flow actually used

takeActionOnFundRequest() (~380 lines, live) resolves product/subproduct/scheme, validates visibility, and guards against double-processing:

```
if (status != PENDING) return 400 "already processed"
```

⚠ An earlier, ~40-line commented-out version of this same method sits directly above the live one — the "old version left as a comment" pattern from Module 2.

Minor: raiseFundRequest() — a third independent tree-walk, no cycle guard

while (true) { parentId = commonMethods.findParentHierarchy(currentId)... currentId = parentId; } climbs the parentAccount chain looking for a WL/AD approver, with no depth limit or cycle check — vulnerable to an infinite loop if Module 2's parentAccount desync ever produces a cycle. A third independent hierarchy-walking implementation, after Module 2's closure table and Module 8's DashboardServiceImpl.

Correctly implemented Flagged risk / minor bug Critical — confirmed financial-correctness bug
